THE MOSQUITO'S FOUR LIVES

EGG
laid on still water · 2-3 days

LARVA
lies flat at the surface · 5-10 days

PUPA
doesn't eat · 2-3 days

ADULT
rests nose-down at an angle

ONLY SHE BITES — she needs blood to make eggs. And the parasite needs **10-18 DAYS** inside her before she can infect anyone.

3 OF 4 LIVES ARE IN WATER — NO WATER, NO MOSQUITOES

WHO WORKED IT OUT

RONALD ROSS · 20 August 1897, India — found the parasite in a mosquito's stomach
Nobel Prize 1902

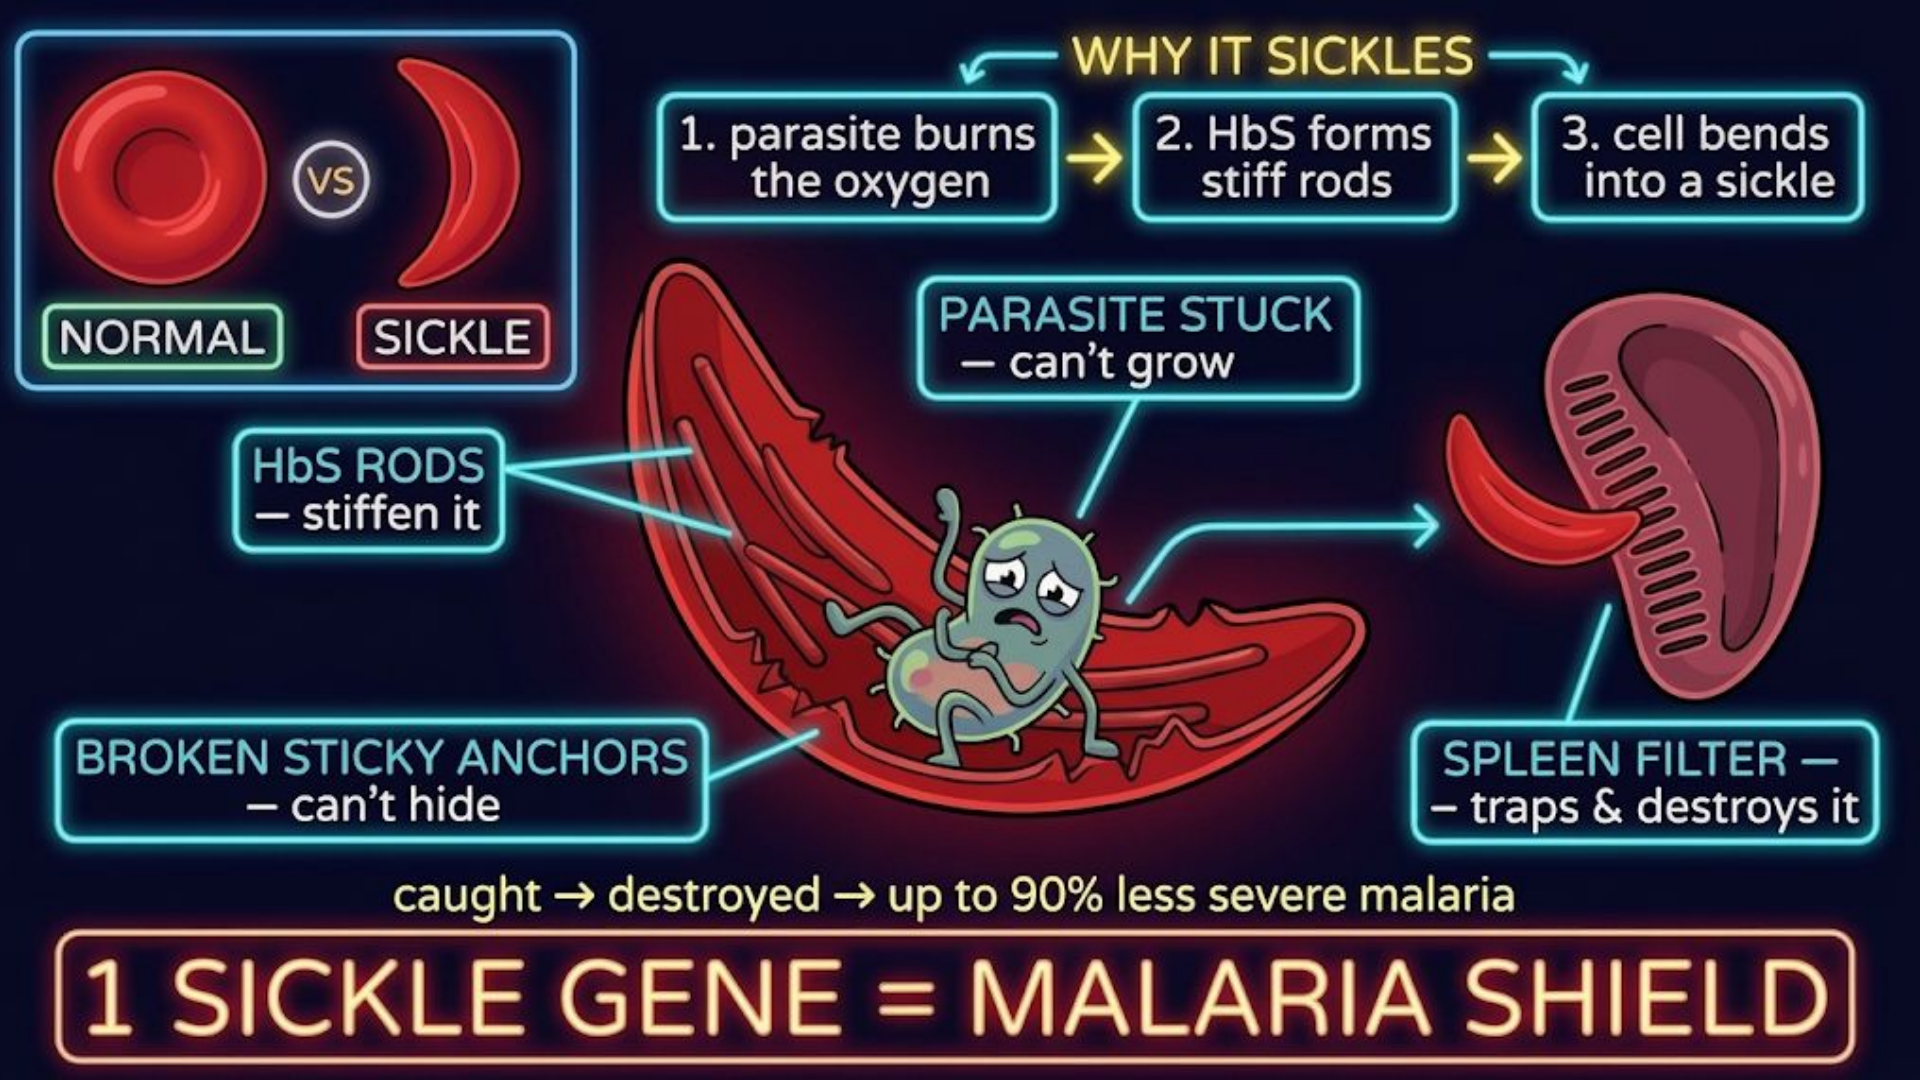

GRASSI'S TEAM in Italy proved it in humans, 1898

STAGE 1 — INJECTED

TOXINS
NEUTRALIZE
DETOX
STAGE 2
THE FACTORY (LIVER)

STAGE 3 – THE RED RAFT
(RED BLOOD CELL)

“STAGE 4 — THE BURST”

NORMAL
VS
SICKLE
WHY IT SICKLES
1. parasite burns the oxygen
2. HbS forms stiff rods
3. cell bends into a sickle
PARASITE STUCK — can't grow
HbS RODS — stiffen it
BROKEN STICKY ANCHORS — can't hide
SPLEEN FILTER — — traps & destroys it
caught → destroyed → up to 90% less severe malaria
1 SICKLE GENE = MALARIA SHIELD

WHY DOESN'T THE SICKLE GENE DISAPPEAR?

0 SICKLE GENES

❌ MALARIA WINS

1 SICKLE GENE

✅ SHIELDED + HEALTHY = WINNER

2 SICKLE GENES

❌ SICKLE DISEASE

so where malaria lives, this gene stays common

SAME GENE — 1 COPY SHIELDS YOU, 2 COPIES MAKE YOU SICK
